

Existence and multiplicity of solutions for class of Navier boundary p -biharmonic problem near resonance

Mohammed Massar, El Miloud Hssini, Najib Tsouli

ABSTRACT: This paper studies the existence and multiplicity of weak solutions for the following elliptic problem
 $\Delta(\rho(x)|\Delta u|^{p-2}\Delta u) = \lambda m(x)|u|^{p-2}u + f(x, u) + h(x)$ in Ω , $u = \Delta u = 0$ on $\partial\Omega$.
 By using Ekeland's variational principle, Mountain pass theorem and saddle point theorem, the existence and multiplicity of weak solutions are established.

Key Words: p -biharmonic, resonance, Ekeland's principle, Mountain pass theorem, saddle point theorem.

1. Introduction and main results

In this article, we are concerned with the following elliptic problem of p -biharmonic type

$$\begin{cases} \Delta(\rho(x)|\Delta u|^{p-2}\Delta u) = \lambda m(x)|u|^{p-2}u + f(x, u) + h(x) & \text{in } \Omega, \\ u = \Delta u = 0 & \text{on } \partial\Omega. \end{cases} \quad (1.1)$$

where $\Omega \subset \mathbb{R}^N (N \geq 1)$ is a bounded smooth domain, $p > 1$, $\rho \in C(\overline{\Omega})$ with $\inf_{\overline{\Omega}} \rho(x) > 0$, $f : \overline{\Omega} \times \mathbb{R} \rightarrow \mathbb{R}$ is a Carathéodory function and $m \in C(\overline{\Omega})$ is nonnegative weight functions.

The investigation of existence and multiplicity of solutions for problems involving p -biharmonic operator has drawn the attention of many authors, see reference.

In [4], Li and Tang considered the following Navier boundary value problem

$$\begin{cases} \Delta(|\Delta u|^{p-2}\Delta u) = \lambda f(x, u) + \mu g(x, u) & \text{in } \Omega, \\ u = \Delta u = 0 & \text{on } \partial\Omega, \end{cases} \quad (1.2)$$

where $p > \max\{1, \frac{N}{2}\}$ and $\lambda, \mu \geq 0$. Under suitable assumptions the existence of at least three weak solutions is established. In [6], Ma and Pelicer study a multiplicity for the perturbed p -Laplacian equation

$$-\Delta_p u = \lambda g(x)|u|^{p-2}u + f(x, u) + h(x) \quad \text{in } \mathbb{R}^N,$$

where λ is near λ_1 , the principal eigenvalue of the weighted problem

$$-\Delta_p u = \lambda g(x)|u|^{p-2}u \quad \text{in } \mathbb{R}^N.$$

they proved the existence of one or three solutions.

In the present paper, we study problem (1.1) that result was extended to the p-biharmonic operator in bounded domains, with the weight functions. We were inspired by Ma and Pelicer [6] in which problems involving the p-laplacian operator is studied. Our technical approach is based on Ekeland's variational principle, Mountain pass theorem and saddle point theorem. We assume that f satisfies the following conditions

(F₁) There exists a real $a > 0$ and a function $b \in L^{(p^*)'}(\Omega)$ such that

$$|f(x, t)| \leq a|t|^{\sigma-1} + b(x) \quad \text{a.e in } \Omega \quad \text{for all } t \in \mathbb{R},$$

with $1 < \sigma < p$.

(F₂) There exist $\alpha > 0$ and $\beta(x) \in L^\infty(\Omega)$ satisfying

$$pF(x, u) - f(x, u)u \geq \alpha|u|^\mu + \beta(x) \quad \text{a.e in } \Omega \quad \text{for all } u \in \mathbb{R},$$

where $1 < \mu \leq \sigma < p$ and $F(x, u) = \int_0^u f(x, s)ds$.

We introduce the space $X := W^{2,p}(\Omega) \cap W_0^{1,p}(\Omega)$, which is a reflexive Banach space endowed with the norm

$$\|u\| = \left(\int_{\Omega} \rho |\Delta u|^p dx \right)^{1/p}, \quad (\text{see, e.g., [1, 10]}).$$

Consider the following problem

$$\begin{cases} \Delta(\rho |\Delta u|^{p-2} \Delta u) = \lambda m(x)|u|^{p-2}u & \text{in } \Omega, \\ u = \Delta u = 0 & \text{on } \partial\Omega. \end{cases} \quad (1.3)$$

Let λ_1 denote the first eigenvalue of problem (1.3). According to the work of M.Talbi and N.Tsouli [10], since $m \in C(\overline{\Omega})$ and $m \geq 0$, λ_1 is positive, simple, isolated and is given by

$$\lambda_1 = \inf \left\{ \int_{\Omega} \rho |\Delta u|^p dx : u \in X, \int_{\Omega} m(x)|u|^p dx = 1 \right\}. \quad (1.4)$$

Therefore

$$\int_{\Omega} \rho |\Delta u|^p dx \geq \lambda_1 \int_{\Omega} m(x)|u|^p dx \quad \text{for all } u \in X. \quad (1.5)$$

Let φ_1 normalized eigenfunction associated to λ_1 , which can be chosen positive. Let

$$\lambda_2 := \inf \{ \lambda : \lambda \text{ is an eigenvalue of (1.3) with } \lambda > \lambda_1 \}. \quad (1.6)$$

The fact that λ_1 is isolated implies that $\lambda_1 < \lambda_2$. It can also be shown (see Lemma 2.1) that there exists $\bar{\lambda} \in (\lambda_1, \lambda_2]$ such that

$$\int_{\Omega} \rho |\Delta u|^p dx \geq \bar{\lambda} \int_{\Omega} m(x) |u|^p dx, \quad (1.7)$$

for all $u \in X$ with $\int_{\Omega} m(x) |\varphi_1|^{p-2} \varphi_1 u dx = 0$.

Definition 1.1. We say that $u \in X$ is a weak solution of problem (1.1) if

$$\int_{\Omega} \rho |\Delta u|^{p-2} \Delta u \Delta \varphi dx - \int_{\Omega} m(x) |u|^{p-2} u \varphi dx - \int_{\Omega} f(x, u) \varphi dx - \int_{\Omega} h(x) \varphi dx = 0,$$

for all $\varphi \in X$.

The corresponding energy functional of problem (1.1) is given by

$$I(u) = \frac{1}{p} \int_{\Omega} \rho |\Delta u|^p dx - \frac{\lambda}{p} \int_{\Omega} m(x) |u|^p dx - \int_{\Omega} F(x, u) dx - \int_{\Omega} h(x) u dx, \quad (1.8)$$

it is well known that $I \in \mathcal{C}^1(X, \mathbb{R})$, with derivative at point $u \in X$ is given by

$$\langle I'(u), \varphi \rangle = \int_{\Omega} \rho |\Delta u|^{p-2} \Delta u \Delta \varphi dx - \lambda \int_{\Omega} m |u|^{p-2} u \varphi dx - \int_{\Omega} f(x, u) \varphi dx - \int_{\Omega} h \varphi dx,$$

for every $\varphi \in X$. Consequently, the critical points of the functional I correspond to the weak solutions of the problem (1.1).

Let here recall the weak version of Mountain pass theorem (see [2], [3]) and the saddle point theorem (see [7]).

Theorem 1.2. *let X be a real Banach space and $I : X \rightarrow \mathbb{R}$ be a C^1 functional satisfying the Palais-Smale condition. Furthermore assume that $I(0) = 0$ and that the following conditions hold:*

- (i) *there exists a number $r > 0$ such that $I|_{\partial B_r} \geq 0$*
- (ii) *there is an element $e \in X \setminus \overline{B_r}$ with $I(e) \leq 0$.*

Then the real number c , characterized as

$$c := \inf_{\gamma \in \Gamma} \max_{t \in [0,1]} I(\gamma(t))$$

where

$$\Gamma := \{\gamma \in C([0,1], X) : \gamma(0) = 0, \gamma(1) = e\}$$

is a critical value of I with $c \geq 0$. If $c = 0$, there exists a critical point of I on ∂B_r corresponding to the critical value 0.

Theorem 1.3. *Let X be a Banach space. Let $I : X \rightarrow \mathbb{R}$ be a C^1 functional that satisfies the Palais-Smale condition, and suppose that $X = V \oplus W$, with V a finite dimensional subspace of X . If there exists $R > 0$ such that*

$$\max_{v \in V, \|v\|=R} I(v) < \inf_{w \in W} I(w),$$

then I has at least a critical point on X .

Now we are ready to state our main result.

Theorem 1.4. *Assume that (F_1) holds. If in addition*

$$\lim_{|t| \rightarrow \infty} F(x, t\varphi_1) = +\infty, \quad \text{uniformly in } x \in \Omega, \quad (1.9)$$

then for any $h \in L^{(p^)}'(\Omega)$, with $(p^*)' = \frac{p^*}{p^*-1}$, satisfying*

$$\int_{\Omega} h(x)\varphi_1 dx = 0, \quad (1.10)$$

problem (1.1) has at least three solutions when λ is sufficiently close to λ_1 from left.

Theorem 1.5. *Assume that (F_1) and (F_2) hold. If in addition $\lambda_1 \leq \lambda < \bar{\lambda}$, then for any $h \in L^{(p^*)}'$, problem (1.1) has at least one solution.*

2. Preliminaries and proofs of Theorems

Let denote $V = \langle \varphi_1 \rangle$ the linear spans of φ_1 and

$$W = \left\{ u \in X : \int_{\Omega} m(x)|\varphi_1|^{p-2}\varphi_1 u dx = 0 \right\}. \quad (2.1)$$

Then we can decompose X as a direct sum of V and W . In fact, let $u \in X$, writing

$$u = \alpha\varphi_1 + w,$$

where $w \in X$, and $\alpha = \lambda_1 \int_{\Omega} m(x)|\varphi_1|^{p-2}\varphi_1 u dx$.

Since

$$\int_{\Omega} \rho |\Delta \varphi_1|^p dx = 1,$$

$$\int_{\Omega} m(x)|\varphi_1|^{p-2}\varphi_1 w dx = 0.$$

Therefore $w \in W$, hence

$$X = V \oplus W.$$

We begin by establishing the existence of $\bar{\lambda}$ for which (1.7) holds.

Lemma 2.1. *There exists $\bar{\lambda} \in (\lambda_1, \lambda_2]$ such that*

$$\int_{\Omega} \rho |\Delta u|^p dx \geq \bar{\lambda} \int_{\Omega} m(x)|u|^p dx, \quad (2.2)$$

for all $u \in W$.

Proof: Let

$$\lambda = \inf \left\{ \int_{\Omega} \rho |\Delta u|^p dx : u \in W, \int_{\Omega} m(x) |u|^p dx = 1 \right\}.$$

This value is attained in W . To see why this is so, let (u_n) be a sequence in W , satisfying $\int_{\Omega} m(x) |u_n|^p dx = 1$ for all n , and $\int_{\Omega} \rho |\Delta u_n|^p dx \rightarrow \lambda$. It follows that (u_n) is bounded in X and therefore, up to subsequence, we may assume that

$$u_n \rightharpoonup u \text{ weakly in } X \quad \text{and} \quad u_n \rightarrow u \text{ strongly in } L^p(\Omega).$$

From the strong convergence of the sequence in $L^p(\Omega)$ we obtain

$$\int_{\Omega} m(x) |u|^p dx = \lim_{n \rightarrow \infty} \int_{\Omega} m(x) |u_n|^p dx = 1$$

and

$$\int_{\Omega} m(x) |\varphi_1|^{p-2} \varphi_1 u dx = \lim_{n \rightarrow \infty} \int_{\Omega} m(x) |\varphi_1|^{p-2} \varphi_1 u_n dx = 0,$$

so that $u \in W$. By the weakly lower semicontinuity of the norm $\|\cdot\|$, we get

$$\lambda \leq \int_{\Omega} \rho |\Delta u|^p dx \leq \liminf_{n \rightarrow \infty} \int_{\Omega} \rho |\Delta u_n|^p dx = \lambda,$$

and hence λ is attained at u .

Now we claim that $\lambda > \lambda_1$. It follows from (1.4) that $\lambda \geq \lambda_1$. If $\lambda = \lambda_1$, by simplicity of λ_1 there is $\alpha \in \mathbb{R}$ such that $u = \alpha \varphi_1$. Since $u \in W$,

$$\alpha \int_{\Omega} m(x) |\varphi_1|^p dx = 0,$$

which implies $\alpha = 0$. This contradicts the fact that $\int_{\Omega} m(x) |u|^p dx = 1$. So, choose $\bar{\lambda} = \min\{\lambda, \lambda_2\}$. It is clear that $\bar{\lambda}$ satisfies (2.2) and the proof of lemma is complete. \square

Lemma 2.2. *Assume that (F1) holds. Then, for $\lambda < \lambda_1$ the functional I is coercive in X , and bounded from below on W . Moreover there exists a constant m independent of λ such that $\inf_W I(u) \geq m$.*

Proof: From (F1), we have

$$\int_{\Omega} |F(x, u)| dx \leq \frac{a}{\sigma} \int_{\Omega} |u|^\sigma dx + \int_{\Omega} b(x) |u| dx$$

By Hölder's and Sobolev's inequalities, it follows from (1.5) that

$$\begin{aligned}
I(u) &\geq \frac{1}{p} \int_{\Omega} \rho |\Delta u|^p dx - \frac{\lambda}{p} \int_{\Omega} m(x) |u|^p dx \\
&\quad - \frac{a}{\sigma} \int_{\Omega} |u|^\sigma dx - \int_{\Omega} b(x) |u| dx - \int_{\Omega} h(x) u dx \\
&\geq \frac{1}{p} \|u\|^p - \frac{\lambda}{p\lambda_1} \|u\|^p - C_1 \|u\|^\sigma - C_2 \|b\|_{(p^*)'} \|u\| - C_3 \|h\|_{(p^*)'} \|u\| \\
&= \frac{1}{p} \left(1 - \frac{\lambda}{\lambda_1}\right) \|u\|^p - C_1 \|u\|^\sigma - C_2 \|b\|_{(p^*)'} \|u\| - C_3 \|h\|_{(p^*)'} \|u\| \quad (2.3)
\end{aligned}$$

where C_1, C_2 and C_3 are the embedding constants of Sobolev. Since $\lambda < \lambda_1$ and $\sigma < p$, I is coercive.

Similarly, let $u \in W$, by Lemma 2.1, for $\lambda < \lambda_1$, we have

$$\begin{aligned}
I(u) &\geq \frac{1}{p} \left(1 - \frac{\lambda}{\lambda_1}\right) \|u\|^p - C_1 \|u\|^\sigma - C_2 \|b\|_{(p^*)'} \|u\| - C_3 \|h\|_{(p^*)'} \|u\| \\
&\geq \frac{1}{p} \left(1 - \frac{\lambda_1}{\lambda}\right) \|u\|^p - C_1 \|u\|^\sigma - C_2 \|b\|_{(p^*)'} \|u\| - C_3 \|h\|_{(p^*)'} \|u\| \quad (2.4)
\end{aligned}$$

Hence I is bounded from below on W . Moreover, we can find a constant m independent of λ such that $\inf_W I(u) \geq m$. \square

Lemma 2.3. *Assume that (F1) and (1.9) hold. Then, for $\lambda < \lambda_1$ sufficiently close to λ_1 , there exist $t^- < 0 < t^+$ such that*

$$I(t^+ \varphi_1) < m \quad \text{and} \quad I(t^- \varphi_1) < m,$$

where m is given by Lemma 2.2.

Proof: By definition of λ_1 and (1.10), we have

$$\begin{aligned}
I(t\varphi_1) &= \frac{|t|^p}{p} \int_{\Omega} \rho |\Delta \varphi_1|^p dx - \lambda \frac{|t|^p}{p} \int_{\Omega} m(x) |\varphi_1|^p dx \\
&\quad - \int_{\Omega} F(x, t\varphi_1) dx - t \int_{\Omega} h(x) \varphi_1 dx \\
&= \frac{|t|^p}{p} \int_{\Omega} \rho |\Delta \varphi_1|^p dx - \frac{\lambda |t|^p}{p\lambda_1} \int_{\Omega} \rho |\Delta \varphi_1|^p dx - \int_{\Omega} F(x, t\varphi_1) dx \\
&= \frac{|t|^p}{p} \left(1 - \frac{\lambda}{\lambda_1}\right) \int_{\Omega} \rho |\Delta \varphi_1|^p dx - \int_{\Omega} F(x, t\varphi_1) dx. \quad (2.5)
\end{aligned}$$

From (1.9), for $t > 0$ large enough, we have

$$F(x, t^+ \varphi_1) \geq 0, \quad \text{a.e. } x \in \Omega,$$

by Fatou's Lemma, we get

$$\begin{aligned} \liminf_{t \rightarrow +\infty} \int_{\Omega} F(x, t^+ \varphi_1) dx &\geq \int_{\Omega} \liminf_{t \rightarrow +\infty} F(x, t^+ \varphi_1) dx \\ &= \int_{\Omega} \lim_{t \rightarrow +\infty} F(x, t^+ \varphi_1) dx \\ &= +\infty, \end{aligned}$$

so, there exists $t^+ > 0$ such that

$$\int_{\Omega} F(x, t^+ \varphi_1) dx > -m + 1. \quad (2.6)$$

For $\lambda_1 - \frac{p\lambda_1}{(t^+)^p} < \lambda < \lambda_1$, (2.5) and (2.6) imply

$$I(t^+ \varphi_1) < m.$$

Similarly, we get $I(t^- \varphi_1) < m$, for some $t^- < 0$. \square

Proof: (Theorem 1.4) First we show that I satisfies the (PS) condition in X , that is for every sequence such that

$$I(u_n) \rightarrow c, \quad I'(u_n) \rightarrow 0, \quad (2.7)$$

possesses a convergent subsequence.

Let $(u_n) \subset X$ be a (PS) sequence. Since I is coercive, (u_n) is bounded in X , so up to subsequence, we may assume that $u_n \rightharpoonup u$ weakly in X . Therefore

$$\langle I'(u_n), u_n - u \rangle = o_n(1). \quad (2.8)$$

By Hölder's inequality, we have

$$\left| \int_{\Omega} m(x) |u_n|^{p-2} u_n (u_n - u) dx \right| \leq \|m\|_{\infty} \left(\int_{\Omega} |u_n|^p dx \right)^{\frac{p-1}{p}} \left(\int_{\Omega} |u_n - u|^p dx \right)^{\frac{1}{p}}. \quad (2.9)$$

Since $u_n \rightarrow u$ in $L^p(\Omega)$,

$$\lim_{n \rightarrow \infty} \int_{\Omega} m(x) |u_n|^{p-2} u_n (u_n - u) dx = 0. \quad (2.10)$$

Since $(\sigma - 1)(p^*)' < p^*$, $u_n \rightarrow u$ strongly in $L^{(\sigma-1)(p^*)}'(\Omega)$, and hence there exists $g \in L^{(\sigma-1)(p^*)}'(\Omega)$ such that

$$|u_n| \leq g \quad \text{a.e. in } \Omega.$$

Thus

$$\begin{aligned} |f(x, u_n)|^{(p^*)'} &\leq 2^{(p^*)'} \left(a^{(p^*)'} |u_n|^{(\sigma-1)(p^*)'} + |b(x)|^{(p^*)'} \right) \\ &\leq 2^{(p^*)'} \left(a^{(p^*)'} g^{(\sigma-1)(p^*)'} + |b(x)|^{(p^*)'} \right). \end{aligned}$$

Since the right side of the last inequality belongs to $L^1(\Omega)$, it follows from Lebesgue theorem that

$$f(x, u_n) \rightarrow f(x, u) \quad \text{in } L^{(p^*)'}(\Omega).$$

By using the fact that $u_n \rightharpoonup u$ in $L^{p^*}(\Omega)$, we deduce that

$$\lim_{n \rightarrow \infty} \int_{\Omega} (f(x, u_n) + h)(u_n - u) dx = 0. \quad (2.11)$$

Combining (2.8), (2.10) and (2.11) we obtain

$$\lim_{n \rightarrow \infty} \int_{\Omega} \rho |\Delta u_n|^{p-2} \Delta u_n \Delta(u_n - u) dx = 0.$$

In the same way, we obtain

$$\lim_{n \rightarrow \infty} \int_{\Omega} \rho |\Delta u|^{p-2} \Delta u \Delta(u_n - u) dx = 0.$$

Therefore, the Hölder inequality imply that

$$\begin{aligned} 0 &= \lim_{n \rightarrow \infty} \int_{\Omega} (\rho |\Delta u_n|^{p-2} \Delta u_n - \rho |\Delta u|^{p-2} \Delta u) \Delta(u_n - u) dx \\ &\geq \lim_{n \rightarrow \infty} \left[\|u_n\|^p - \left(\int_{\Omega} \rho |\Delta u_n|^p dx \right)^{\frac{p-1}{p}} \left(\int_{\Omega} \rho |\Delta u|^p dx \right)^{1/p} \right. \\ &\quad \left. - \left(\int_{\Omega} \rho |\Delta u|^p dx \right)^{\frac{p-1}{p}} \left(\int_{\Omega} \rho |\Delta u_n|^p dx \right)^{1/p} + \|u\|^p \right] \\ &= \lim_{n \rightarrow \infty} [\|u_n\|^p - \|u_n\|^{p-1} \|u\| - \|u\|^{p-1} \|u_n\| + \|u\|^p] \\ &= \lim_{n \rightarrow \infty} (\|u_n\|^{p-1} - \|u\|^{p-1})(\|u_n\| - \|u\|) \geq 0, \end{aligned}$$

hence $\|u_n\| \rightarrow \|u\|$. By the uniform convexity of X , it follows that $u_n \rightarrow u$ strongly in X and I satisfies the (PS) condition.

Next, let

$$\Lambda^{\pm} = \{u \in X : u = \pm t\varphi_1 + w, t > 0, w \in W\}. \quad (2.12)$$

Let $(u_n) \subset \Lambda^+$ such that $I(u_n) \rightarrow c < m$ and $I'(u_n) \rightarrow 0$ as $n \rightarrow \infty$. Then $u_n \rightarrow u$ strongly in X . Noting that $\partial\Lambda^+ = W$. So, if $u \in \partial\Lambda^+$, it follows from $\inf_W I \geq m$ that

$$I(u_n) \rightarrow c = I(u) \geq m,$$

which is impossible. Therefore $u \in \Lambda^+$, and hence I satisfies the $(PS)_{c, \Lambda^+}$ for all $c < m$. Similarly, I satisfies the $(PS)_{c, \Lambda^-}$ for all $c < m$.

In view of Lemma 2.3 for $\lambda < \lambda_1$ sufficiently close to λ_1 , we have

$$-\infty < \inf_{\Lambda^+} I < m. \quad (2.13)$$

By Ekeland's variational principle in $\overline{\Lambda^+}$, there exists a sequence $(u_n) \subset \Lambda^+$ such that

$$I(u_n) \rightarrow \inf_{\Lambda^+} I \quad \text{and} \quad I'(u_n) \rightarrow 0.$$

Since I satisfies the $(PS)_{c, \Lambda^+}$ for all $c < m$, there exists $u^+ \in \Lambda^+$ such that $I(u^+) = \inf_{\Lambda^+} I$. Similarly, we find $u^- \in \Lambda^-$ such that $I(u^-) = \inf_{\Lambda^-} I$. Hence I has two distinct critical points u^+ and u^- .

Now, we prove the existence of the third solution. To fix ideas, suppose that $I(u^+) \leq I(u^-)$ and Putting

$$J(u) := I(u + u^-) - I(u^-), \quad e = u^+ - u^-.$$

So, $J(0) = 0$, $J(e) \leq 0$. We can find $r > 0$ such that $\overline{B(u^-, r)} \subset \Lambda^-$, thus

$$\inf_{\|u - u^-\| = r} I(u) \geq I(u^-) \quad \text{and hence} \quad \inf_{\|u\| = r} J(u) \geq 0. \quad \text{Let}$$

$$c = \inf_{\gamma \in \Gamma} \max_{t \in [0, 1]} I(\gamma(t)), \quad (2.14)$$

where

$$\Gamma = \{ \gamma \in C([0, 1], X) : \gamma(0) = u^-, \gamma(1) = u^+ \}.$$

Since J also satisfies the (PS) condition and $J' = I'$, it follows from the Mountain pass theorem 1.2 that c is a critical value of I . Noting that all paths joining u^- to u^+ pass through W , so $c \geq m$. Therefore the third solution is obtained, and the proof of theorem is complete. \square

Proof: (Theorem 1.5) The proof will be divided in some steps.

Step 1 (the growth of F).

We prove that for some $C_1, C_2 > 0$,

$$\int_{\Omega} F(x, t\varphi_1) dx \geq C_1 \|t\varphi_1\|^\mu - C_2. \quad (2.15)$$

From (F_2) , we have

$$\frac{d}{du} \left(\frac{F(x, u)}{|u|^p} \right) \leq -\alpha |u|^{\mu-p-2} u - \beta(x) |u|^{-p-2} u, \quad (u > 0).$$

Noting that $\frac{F(x, u)}{|u|^p} \rightarrow 0$ as $u \rightarrow \infty$, thus after integration from $u > 0$ to $+\infty$, we see that

$$F(x, u) \geq \frac{\alpha}{p - \mu} |u|^\mu + \frac{\beta(x)}{p}$$

Since this inequality holds for $u < 0$, we get

$$\begin{aligned} \int_{\Omega} F(x, t\varphi_1) dx &\geq \frac{\alpha |t|^\mu}{p - \mu} \int_{\Omega} |\varphi_1|^\mu dx + \frac{1}{p} \int_{\Omega} \beta(x) dx \\ &\geq \frac{\alpha |t|^\mu}{p - \mu} \int_{\Omega} |\varphi_1|^\mu dx - \frac{1}{p} \|\beta\|_\infty |\Omega| \\ &\geq C_1 |t|^\mu - C_2 \end{aligned}$$

and (2.15) follows.

Step 2 (the Palais-Smale condition). Let (u_n) be a sequence satisfying (2.7), we note that

$$\begin{aligned} \langle I'(u_n), u_n \rangle - pI(u_n) &= \int_{\Omega} pF(x, u_n)dx - \int_{\Omega} f(x, u_n)u_n dx + (p-1) \int_{\Omega} hu_n dx \\ &\geq \alpha \int_{\Omega} |u_n|^{\mu} dx + \int_{\Omega} \beta(x)dx + (p-1) \int_{\Omega} hu_n dx \\ &\geq \alpha C_3 \|u_n\|^{\mu} - C_4 \|h\|_{L^{(p^*)'}} \|u_n\| + C_5. \end{aligned} \quad (2.16)$$

From the boundedness of $\langle I'(u_n), u_n \rangle - pI(u_n)$, we deduce that (u_n) is bounded in X . By a similar argument as in the proof of Theorem 1.4, we conclude that (u_n) possesses a convergent subsequence in X .

Step 3 (the saddle point theorem). Using again Lemma 2.1, we get

$$\begin{aligned} I(u) &\geq \frac{1}{p} \int_{\Omega} \rho |\Delta u|^p dx - \frac{\lambda}{p} \int_{\Omega} m(x) |u|^p dx \\ &\quad - \frac{a}{\sigma} \int_{\Omega} |u|^{\sigma} dx - \int_{\Omega} b(x) |u| dx - \int_{\Omega} h(x) u dx \\ &\geq \frac{1}{p} \left(1 - \frac{\lambda}{\bar{\lambda}} \right) \|u\|^p - C_1 \|u\|^{\sigma} - C_2 \|b\|_{(p^*)'} \|u\| - C_3 \|h\|_{(p^*)'} \|u\|. \end{aligned}$$

Since $\lambda < \bar{\lambda}$,

$$\inf_{w \in W} I(w) > -\infty. \quad (2.17)$$

On the other hand, by (2.15) we see that

$$I(t\varphi_1) \leq - \left(\frac{\lambda - \lambda_1}{p\lambda_1} \right) \|t\varphi_1\|^p - C_1 \|t\varphi_1\|^{\mu} + C \|h\|_{(p^*)'} \|t\varphi_1\| + C_2.$$

It follows from $\lambda \geq \lambda_1$ and $1 < \mu < p$ that

$$\lim_{v \in V, \|v\| \rightarrow \infty} I(v) = -\infty. \quad (2.18)$$

By (2.17) and (2.18), there exists $R > 0$ such that

$$\max_{v \in V, \|v\|=R} I(v) < \inf_{w \in W} I(w).$$

Hence, I satisfies the hypotheses of Theorem 1.3, and there exists a critical point of I , that is a solution of (1.1). \square
